

(A Division of MOMAR)

PRODUCT SUMMARY

AF-2100 - general purpose liquid de-foamer for use in prevention of foaming on any open water system e.g. recirculating cooling water, fountains, etc.

ALG-100 - wide spectrum QAC-based liquid biocide, effective for control of algae and bacteria in recirculating water systems such as cooling towers, heat exchangers, etc.

ALG-200 - very effective liquid biocide (thiocarbamate based) for control of bacteria and fungi commonly found in industrial recirculating water cooling systems, such as cooling towers, air washers, evaporative condensers, etc.

ALG-400 - highly effective liquid biocide (isothiazolin based) which will control growth of micro-organisms in a cooling system across the complete range of organisms: algae, bacteria, fungi, etc.

AQUATROL X DESCALER - liquid acid descaler for boilers and cooling towers.

CC-2700 - is a concentrated liquid dispersant and anti-foulant for use in treatment of recirculating cooling water systems such as cooling towers, heat exchangers, etc. Product will disperse compacted deposits which may cause congestion and inefficient heat transfer, allowing removal from the system by bleed, flushing or draining.

C-2712 - is a concentrated liquid chlorinating compound. Its primary application is for controlling algae, fungi, bacteria and slime in industrial recirculating cooling water systems.

CP-122 and CP-126 - multi-functional liquid cooling water treatment products. Prevents scale formation; provides corrosion inhibition; maintains clean heat transfer surfaces; effectively disperses suspended solids. CP-122 for use where make up water calcium hardness is 0-60 ppm; CP-126 for 60-200 ppm make up water calcium hardness.

CT-110 - multi-functional liquid cooling water treatment product. Primarily intended for use where soft water, either artificial or natural, is used for cooling water make-up. Prevents scale formation; provides corrosion inhibition; maintains clean heat transfer surfaces; effectively disperses suspended solids.

KOMLETE - a total one drum liquid treatment product designed to meet all requirements of cooling tower water. Primarily intended for use where soft water, either artificial or natural, is used for cooling water make-up. Prevents scale

formation; provides corrosion inhibition; maintains clean heat transfer surfaces; effectively disperses suspended solids.

L-5176 - liquid closed system water treatment product. Provides excellent long lasting corrosion protection in hot or cold systems.

P-5538 - liquid potable water treatment product, for use in domestic or industrial potable water supply systems. Provides corrosion inhibition; prevents carbonate scale formation; eliminates “red water” by preventing iron oxidation and resultant staining of fixtures.

PC-2975 - liquid alkaline detergent cleaner. Prepares new systems for use. Cleans heat exchanger surfaces. Removes dirt, silt, mill scale, oil residue and other debris from new or fouled re-circulating water systems.

S-6250 - liquid oxidising agent based on hydrogen peroxide. Effective for controlling odours caused by sulfur-containing compounds in wastewater treatment.

S-6589 - liquid on-line acid cleaner for use in recirculating water systems to remove accumulations of rust and corrosion products. Use in cooling towers, evaporative condensers, cold or hot water loops.

S-6645 - powdered acid scale remover. Strong non-hydrochloric acid based cleaner. Dissolves carbonate and non-carbonate deposits. Safe on galvanised surfaces.

S-6960 - liquid corrosion inhibitor for protecting off-line or stored open cooling systems, over extended layup periods, in wet storage conditions. Proper application results in the formation of a stable protective film on the system.
